

Open Scholarship: Publishing Research Outcomes, FAIR Principles and DOI

Open Publishing and FAIR Principles

Open Research in the Digital Humanities

Dr Nadezhda Povroznik

Research Associate, Humanities Data Science and Methodology (HDSM)
Institute of History, Technical University of Darmstadt

**Dieses Projekt wurde durch das BMFTR-Verbundprojekt HERMES gefördert.*

Open Scholarship and Accessible Outputs

Open scholarship supports:

- access
- critical scrutiny
- citation and credit
- collaboration
- reuse

Digital Humanities outputs:

articles · datasets · code · notebooks · visualisations · editions · tools

Visibility does not determine reuse — the licence and access conditions matter.

FAIR Principles and the Role of the DOI

Findable
metadata and a persistent identifier

Accessible
clear access conditions

Interoperable
shared formats and identifiers

Reusable
understandable content and conditions of use

A DOI (Digital Object Identifier):

- identifies a specific output or version
- supports citation
- connects related research outputs

A DOI alone does not make a resource reusable — metadata, description, version, access conditions and licensing are still needed.

When Should a Dataset Be Published?

- **Unchanged data:** cite and link to the original resource, and record the version or access date.
- **A separate dataset** becomes appropriate when you create a meaningful research object from the original — by filtering, correcting, standardising, enriching, restructuring, combining, annotating or classifying it.
- **Timing is a decision:** an early deposit preserves a dated version and supports feedback; a later deposit provides a stable, curated version for citation. Versioned repositories support both.

As open as possible, as closed as necessary.

Publishing a Research Output

Before publishing:

Course principle: publish a research object that you have created, not an unchanged copy of a source dataset.

The Journal of Open Humanities Data offers one model: its data papers describe humanities research objects and give a dataset its own scholarly identity.
